

Application Development

We think outside the box to tailor dynamic solutions to meet your business needs.

Combining technology acumen with deep business understanding is how we deliver the most value. Web applications, IT middleware, mobile, user experience and visual design is where our expertise lies. We can shape these experiences by learning how your entity conducts its work, and creating an intuitive application with a focus on performance, synchronization, and ease of use. Based on your needs, we recommend the best system architecture to positively impact your business model.

Great User Experience

We learn how your target audience will use the application, and create the design around their needs.

Improving Business

Deploying a new application allows us to integrate business process improvements. Self service, ease of use, and access to information make your users more efficient at their jobs.

Always Available

Custom Applications are always available, whether you are in the office, working from home, or several time zones away.

Types of Applications

Our team of experts is able to create the following applications - web, enterprise, real-time, portal, chat, native, mobile, survey, communication tools, new operations, business intelligence, data visualization/analysis, legacy rewrites, and more.

Code

We can develop iOS (Objective-C) and Android (Java) applications (both to be distributed via app stores), AND custom apps distributed privately for iPads/tablets on kiosks or in a conference booth.
